03-JUN-1
     The present sequence is that of the full insert sequence of clone sem.pk0031.d12, which includes a full-length coding region for soybean steroid delta-14 reductaes 6 fee AAB20381). The clone was isolated from a soybean shoot meristem cDNA library, following homology searches. The predicted protein shows amino acid sequence homology to Arabidopsis thalians and Ascobolus immersus steroid delta-14 reductases. The invention relates to isolated polymucleotides encoding steroid delta-14 reductases and to transgenic plants comprising such polymucleotides. It also relates to the construction of a chimeric gene encoding all or a portion of the steroid delta-14 reductases, in sense or antisense crientation, where expression of the chimeric gene results in production of altered levels of the enzyme in a transformed host cell. The availability of plant steroid delta-14 reductase genes will provide a means of altering steroid production and/or composition of plants, to identify compounds that may be production of herbicides and fungicides, and to identify mutants of these genes that are resistant to these herbicides and will enable the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ехоп
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exon
                                                                                                                                                                                                                 exon
                                                                   Key
contact close bill includes a coding region for a novel C-14 sterol reductase (see AAW41576) of Arabidopsis thaliana. An Arabidopsis mutant, ell (extra long life), that displayed a life span that was at least 3 times greater then wild-type plants, was isolated. The ell mutant was isolated by T-DNA tagging, and used to screen cDNA and genomic libraries from a wild-type plant to identify close DI3 and a 6588 by genomic close (see AAV04238). A pura plant C-14 sterol reductase (C145R) is claimed, as are purified DNA encoding C145R, a vector, a method of producing recombinant C145R using transformed plant cells, a transgenic plant that expresses C145R bNA and a seed or cell from such a plant, and methods for detecting and isolating c cusing an antisense construct. The genetic manipulation of plant sterol composition is useful for improving food quality and oil stability, and for regulating the formation of C145R can increase the life-span of properties. Reduced production of C145R can increase the life-span of plants and produce plants having reduced and more compact proportions. Overproduction is useful for enhancing the production of medically or agriculturally useful steroid compounds. C145R polypeptides are also the production of the sterol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GGAATTGCAAGGCACTGTAATTACCTTGGCGACTTGATGCTTGTCTCTTCTGTTTG 1025

This genomic DNA includes coding exons for a novel C-14 sterol reductase (see AAW41576) of Arabidopsis thaliana. An Arabidopsis mutant, ell (extra long life), that displayed a life span that was at least 3 times greater then wild-type plants, was identified. The ell mutant was isolated by T-DNA tagging, and used to screen genomic and cDNA libraries from a wild-type plant to identify the 6588 bp genomic clone and cDNA clone DNA clone DNA tagging, and used to screen genomic clone and cDNA clone DNA clon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated plant C-14 sterol reductase gene - used to develop products for the genetic manipulation of a plant sterol biosynthetic pathway to improve plant characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               T; 0 U; 80 Other;

The present invention relates to a method for diagnosing breast cancer in a subject suspected of having endometrial cancer. The method comprises determining the expression of a set of human genes or expression products in an endometrial sample suspected of being cancerous. The human genes of characterised as high or low MAI (mitoric activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their protein products. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their protein products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment of endometrial cancer. ABX35531-ABX35531 represent the human genes of the invention that are differentially expressed in breast cancer tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        THE SECOND TO THE TRANSPORT THE THE TRANSPORT THE TRANSPOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing breast cancer comprises determining expression of nucleic acid molecules or expression products that are differentially expressed in normal and malignant tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        82

```
The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA detecting the level of expression of gene(s) (GS) identified by CAP and the specification, and comparing the expression level to an expression level in an unactivated GC, where a comparing the comparing that a comparing the captesion of at least one gene in GS; (S) screening (M3) GA by contacting GC with an agent that alters the modulating (M2) GA by contacting GC with an agent that alters the capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (M4) an inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from GS, where the level of expression in a sample of the tissue of gene(s) from GS, where the level of expression in a sample of the disease by detecting the level of expression of the gene is indicative of inflammation; (4) treating configuration (MS) an inflammatory disease, by contacting a tissue having inflammation with an esponse in a subject, exposure of a subject to a pathogen or sterile inflammation in a tissue, an allergic response in a tissue, an allergic response in a tissue, an allergic response in a subject to a pathogen or sterile inflammation (GSPecially chronic) in a tissue, an allergic response in a subject to a pathogen or sterile inflammation (GSPecially chronic) in a tissue, an allergic response in a subject to exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatoin injury, renal reperfusion injury, ARDS, adult cardiac reperfusion injury, renal reperfusion injury, sand reperfusion injury, sand respectively bowel disease, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.

disease, ulcerative colitis, periodontal disease; also bacterial infection, viral infection, parasitic infection, protozoal infection, fungal infection and MS is useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this parent not form part of the printed specification, but was obtained in electronic format directly from MDO at the wipo.int/pub/published_pct_sequences

The present invention relates to a method for predicting a toxic effect
of a compound. The method comprises preparing a gene expression profile
of a tissue or call sample exposed to the compound, and comparing the
gene expression profile to a database comprising SEQ ID 1-4925, where
differential expression of the gene indicates at least one toxic effect.
The method is useful for predicting at least one toxic effect of a compound, predicting hepatocoxicity or the progression of a toxic effect.

To a compound, identifying an agent that modulates the onset or
progression of a toxic response, predicting the cellular pathways that a
compound modulates in a cell, and identifying an agent that modulates at
compound modulates in a cell, and identifying an agent that modulates at
compound adulates in a cell, and identifying in contact modulates at
compound activity of a protein. The method and compositions of the
differential expression, are useful in identifying toxicity markers in
liver tissues or cells for drug screening and toxicity markers in
liver tissues or cells for drug screening and toxicity assays. Note: The
sequence date for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                 Predicting a toxic effect of a compound, useful in identifying toxicity markers in liver tissues or cells for drug screening and toxicity assays, comprises preparing gene expression profile of tissue or cells exposed to the compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     417

                                                                                                             g
                                                                                                                                                                                                                                                                                                                               The present invention relates to 26 secreted human proteins. The preteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and any involving abnormal angiogenesis, neurodegeneration

The present sequence encodes a human secreted protein. Human secreted protein polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or amelicrating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haemacopoises regulating activity, tissue growth activity, activity, chemotactic/chemokinetic activity, and thrombolytic activity, receptor/ligand activity, and thrombolytic activity, receptor/ligand activity, and tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune desorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus cutoimmune disorders e.g. woulding arthritis, autoimmune pulmonary inflammation.

The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (WTHD), in the induction of tumour immunity, mycloid or lymphoid cutos, incisions and ulcers; as well as in treatment of periodontal disease, disease, disease, whutlington's disease, anylotrophic lateral corrections, and Shy-Drager syndrome, infections, infanction of cardiac and central nervous system vessel e.g. stroke, sepsis, inflammatory disease, bone regeneration. The protein, having activin- or inhibin-related activities is useful as a contraceptive based on the spermatogenesis in male mammals. The proteins and nucleic acids are also contined to the contral as took supplements. The proteins and nucleic acids are also contined to the contraction of secreted activities is useful as sequence encodes a secreted

The invention relates to isolated polynucleotides (ABA90876-ABA90968 and ABA908090) and encoded proteins (ABB55809, especially Companies SEQ ID No 19 (ABA90885) and proteins SEQ ID No 19 (ABA90885) and proteins SEQ ID No 20 (ABB55707) contained in proteins SEQ ID No 20 (ABB55707) contained in clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 care deposited with the American Type Culture Collection (ATCC) with correspondenties, activity, inmunomodulator, vulnerary, controprotective, activity, inhibin, chemotactic, hamostatic, thrombolytic and anti-inflammatory activity and acting as cytokine modulators, haematopoiesis regulators, tissue growth modulators and/or cadherin and anti-inflammatory activity and acting as cytokine modulators. Companies of the following diseases: immune deficiency and disorders; e.g. bacterial correlations and ulcers, osteoporosis or the following diseases: immune deficiency and disorders; e.g. bacterial crythematosus or graft-versus-host disease; myeloid or lymphoid cell deficiencies; wound, burns, incisions and ulcers, osteoporosis or cythematosus or graft-versus-host disease, myeloid or lymphoid cell deficiencies; wound, burns, incisions and ulcers, osteoporosis or conteopathies, e.g. Alzheimer's Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis or Shy-Drager syndrome, hemophila, cardiac inflammatory response syndrome, ischaemia-reperfusion injury, endotoxin lethality, arthitis, inflammatory bowel disease or Crohn's child in dease, or tumours or cancers, pemphigus vulgaris or pemphigus foliaceus
New secreted proteins and encoding polynucleotides, useful in gene therapies, particularly for preventing or treating autoimmune disorders, cancer, graft-versus-host disease, wound, osteoporosis, stroke or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2481 BP; 471 A; 764 C; 655 G; 589 T; 0 U; 2 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2481

Patent No. 5512472
GENERAL INCRMATION:
APPLICANT: Lai, Margaret H. K.
APPLICANT: Bard, Martin
APPLICANT: Bard, Martin
APPLICANT: Arisch, Donald R.
TILLE OF INVENTION: A DNA Sequence Encoding Sterol Delta
Patent No. 5512472
TITLE OF INVENTION: Reductase
NUMBER OF SEQUENCES: 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SOFTWARE: Patentin Release #1.0, Version #1.25

; Sequence 3, Application US/09342653
; Patent No. 6306632
; GENERAL INFORMATION:
; APPLICANT: Cahoon, Rebecca E.
; APPLICANT: Rafalski, Antoni
; TITLE OF INVENTION: Chromatin Associated Proteins
; FILE REFERENCE: BB-1118
; CURRENT APPLICATION UNMERR: US/09/342,653
; CURRENT FILING DATE: 1999-06-29
; EARLIER APPLICATION NUMBER: 60/092,841
; EARLIER APPLICATION NUMBER: 60/092,841
; MUMBER OF SEQ ID NOS: 7
; SEQ ID NO 3
; SEQ ID NO 3

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

Patent No. 6465717
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Famedu, Omolayo O.
APPLICANT: Rafalski, Antoni
APPLICANT: Shen, Jennel
TITLE OF INVENTION: Sterol Metabolism Enzymes
FILE REFERENCE:
     TELERAX: 201-831-3244
INFORMATION FOR SEQ ID NO: 1: SEQUENCE CHARACTERISTICS:
LENGTH: 2528 bases
TYPE: nucleic acid
STRANDENESS: double
FOPOLOGY: linear
MOLECULE TYPE:
DESCRIPTION: DNA encoding a polypeptide
FRAGMENT TYPE: entire sequence
IMMEDIATE SOURCE: Saccharomyces cerevisiae
IMMEDIATE SOURCE: clone

                                                                         The present sequence is that of the full insert sequence of clone ssm.pk0031.d12, which includes a full-length coding region for soybean sterol delta-14 reductase (see AAB20381). The clone was isolated from a sterol delta-14 reductase (see AAB20381). The clone was isolated from a predicted protein shows anno acid sequence homology to Arabidopsis thaliana and Ascobolus immersus sterol delta-14 reductases. The invention relates to isolated polymucleotides encoding sterol delta-14 reductases and to transgenic plants comprising such polymucleotides. It also relates to the construction of a chimeric gene encoding all or a portion of the sterol delta-14 reductase, in sense or antisense orientation, where sterol delta-14 reductase genes will provide a means of alterial sterol composition of plants. Compounds that may be useful as novel herbicides and fungicides, and to identify mutants of these genes that are resistant to these herbicides and will enable the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel gene encoding sterol delta-14 reductase useful for transgenic plant production with altered sterol delta-14 reductase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                     The present sequence is that of the full-insert sequence of clone p0097.cgrau67za:fis, coding for corn sterol delta-14 reductase (see AAB20379). The clone was isolated from a cDNA library prepared from corn v9 whorl section + ECB1, following database homology searches. The predicted polypeptide shows amino acid sequence homology to Arabidopsis thaliana and Ascobolus immersus sterol delta-14 reductases. The invention of relates to isolated polymulecides encoding sterol delta-14 reductases and to transgenic plants comprising such polymulecides. It also relates to the construction of a chimmeric gene encoding all or a portion of the sterol delta-14 reductase, in sense or antisense orientation, where expression of the chimeric gene results in production of altered levels of the enzyme in a transformed host cell. The availability of plant sterol delta-14 reductase genes will provide a means of altering sterol production and/or composition of plants, to identify compounds that may be useful as novel herbicides and fungicides, and to identify mutants of these genes that are resistant to these herbicides and will enable the composition of herbicides and will enable the
                                                 Novel gene encoding sterol delta-14 reductase useful for transgenic plant production with altered sterol delta-14 reductase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        493

```
New isolated plant C-14 sterol reductase gene - used to develop products for the genetic manipulation of a plant sterol biosynthetic pathway to improve plant characteristics.
```

Claim 7; Fig 14; 71pp; English

(see AAW41576) of Arabidopsis thaliana. An Arabidopsis mutant, ell (extra cond state) of Arabidopsis thaliana. An Arabidopsis mutant, ell (extra cond life), that displayed a life span that was at least 3 times graater then wild-type plants, was isolated. The ell mutant was isolated by T-DNA tagging, and used to screen cDNA and genomic libraries from a wild-type plant to identify clone D13 and a 6588 by genomic clone (see AAV04238). A pure plant C-14 sterol reductase (C145R) is claimed, as are purified DNA encoding C145R, a vector, a method of producing recombinant C145R using transformed plant cells, a transgenic plant that expresses C145R DNA and a seed or cell from such a plant, and methods for detecting and isolating a seed or cell from such a plant, and methods for detecting and isolating a c145R gene, and for reducing the level of C145R in a transgenic plant composition is useful for improving food quality and oil stability, and composition is useful for improving food quality and oil stability, and correquenties. Reduced production of C145R can increase the life-span of plants and produce plants having reduced and more compact proportions. Overproduction is useful for enhancing the production of medically or agriculturally useful steroid compounds. C145R polypeptides are also useful for the development of enzyme inhibitors of the sterol

This genomic DNA includes coding exons for a novel C-14 sterol reductase

(see AAW41576) of Arabidopsis thaliana. An Arabidopsis mutant, ell (extra
long life), that displayed a life span that was at least 3 times greater
then wild-type plants, was identified. The ell mutant was isolated by T-
DNA tagging, and used to screen genomic and cDNA libraries from a wild-
type plant to identify the 6588 bp genomic clone and cDNA clone D13 (see
plant to identify the 6588 bp genomic clone and cDNA clone D13 (see
DNA tagging, and used to screen genomic clone and cDNA clone D13 (see
DNA tagging transformed plant cells, a transgenic plant that expresses
C145R bNA and a seed or cell from such a transgenic plant that expresses
C145R bNA and a seed or cell from such a transgenic plant, and methods
C145R in a transgenic plant using an antisense construct. The genetic
manipulation of plant sterol composition is useful for improving food
quality and oil stability, and for regulating the formation of cuapentally increase the life span of plants and produce plants having reduced and
more compact proportions. Overproduction is useful for enhancing the
production of medically or agriculturally useful for enhancing the
character of the compact proportion is useful for enhancing the
character of the compact proportion is useful for enhancing the
character of the compact proportion is useful for enhancing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to the identification and isolation of novel nucleic acid molecules that confer altered visual phenotypes in plants. Specifically, it refers to modifications of plant architecture and/ or leaf surface features in plants, such as chlorotic, bleaching, etching, wet leaf, stunting, elongation and texture phenotypes, which are thought will be agronomic traits beneficial to the farmer. As such, these novel phenotypes can affect growth regulation i.e. useful for creating dwarf to varieties, exhibit resistance to insects or heat stress, confer changes in planet such that plants have enhanced vitamin production or delayed senescence and also for example produce plants that control the production of ethylene. Furthermore, the present invention comprises production of ethylene. Furthermore, the present invention comprises phenotype of plant seeds, plant tissues and plant cells containing the polymucleotides described herein. This polymucleotide is a homologue of a plant the plants that meaning the plants that containing the plants that meaning an altered visual phenotype when expressed in

The present sequence is that of expressed sequence tag clone src3c.pk009.c1, which includes a partial coding region for soybean sterol delta-14 reductase (see AAB20378). The clone was isolated from a cDNA library prepared from soybean 8-day-old root infected with cyst nematode, following database homology searches. The predicted polypeptide shows amino acid sequence homology to Arabidopsis thaliana sterol delta-14 reductase. The invention relates to isolated polymucleotides encoding sterol delta-14 reductases and to transgenic plants comprising such polymucleotides. It also relates to the construction of a chimeric gene encoding all or a portion of the sterol delta-14 reductase, in sense or antisense orientation, where expression of the chimeric gene results in continuous and altered levels of the enzyme in a transformed host cell. The availability of plant sterol delta-14 reductase genes will provide means of altering sterol production and/or composition of plants, to identify compounds that may be useful as novel herbicides and fungicides, and to identify mutants of these genes that are resistant to these herbicides and will enable the production of herbicide-resistant crops
                                                                                                                                             Novel gene encoding sterol delta-14 reductase useful for transgenic plant production with altered sterol delta-14 reductase.
                                                                                                                                                                                                                                   Claim 7; Page 35; 45pp; English

The present invention relates to a method for diagnosing breast cancer in a subject suspected of having endometrial cancer. The method comprises determining the expression of a set of huan genes or expression products in an endometrial sample suspected of being cancerous. The huan genes of the invention are differentially expressed in breast tumours of characterised as high or low MAI (mitotic activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their protein products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment of endometrial cancer, ABRX35531-ABX35581 represent the human genes of the invention that are differentially expressed in breast cancer tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ACGCCTCTTATTGATGGAAGAAGACTCAAGTATAGATTAAATGGATTCTATCCTTTTATC 984

Homo sapiens.

The invention relates to detecting (M1) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are medulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in GS; (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue or sterile inflammatory disease using the gene expression of pathogen or sterile inflammatory disease using the gene expression of profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression in a subject, exposure of a subject to a pathogen or sterile inflammation of the gene is indicative of inflammation will ammation agent that modulates the expression of gene(s) from Gs, where the level of inflammation wisease, by contacting a tissue having inflammation wisease, by contacting a tissue having inflammation in a tissue, M4 is useful for modulating GA, preferably, in an expension in a tissue, an allergic response in a subject to a pathogen or sterile of inflammation in a tissue, an allergic response in a subject of conscrening an agent capable of modulating GA, preferably, in an expension of gene(s) from Gs in the tissue, M4 is useful for detecting an inflammation of gene(s) cardiac reperfusion injury, renal reperfusion injury, ARDS, adult respiratory disterses sundreme, inflammatory disterses (or incartive, inflammatory disease, confirsue, inflammatory disease, confir did disease, ulcerative colitis, periodontal disease; also bacterial infection, viral infection, parasitic infection, protozoal infection, fundal infection and MS is useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent of the printed specification, but was obtained in electronic format directly from MIPO at the printed specification and the printed specification are obtained in fig. wipo.int/pub/published_pct_sequences

The clone was isolated from a CDNA library prepared from soybean 8-day-old root infected with cyst nematode, following database homology searches. The predicted polypeptide shows amino acid sequence homology to Arabidopsis thaliana and Ascobolus immersus sterol delta-14 reductases. The invention relates to isolated polynucleotides encoding sterol delta-14 reductases and to transgenic plants comprising such polynucleotides. It also relates to isolated construction of a chimeric gene encoding all or a portion of the sterol delta-14 reductase, in sense or antisense orientation, where expression of the chimeric gene results in production of altered levels of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 enzyme in a transformed host cell. The availability of plant sterol delta-
14 reductase genes will provide a means of altering sterol production
and/or composition of plants, to identify compounds that may be useful as
novel herbicides and fungicides, and to identify mutants of these genes
that are resistant to these herbicides and will enable the production of
herbicide-resistant crops
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel gene encoding sterol delta-14 reductase useful for transgenic plant production with altered sterol delta-14 reductase.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene contributes to the virulence and/or pathogenicity of a fungus, a gene contributes to the virulence and/or pathogenicity of a fungus, a gene contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus of and for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent that inhibits the growth of a diploid fungus to compound extabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, signal fransduction, DNA replication and cell division activity, the method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for trataling infection by C. albicans. The present sequence is that of an essential candida albicans gene used in the method of the invention. Note: The sequence data for this parent is not represented in the printed the burners of the printed t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            417

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            128
                                                                                                                                                    The S. cerevisiae sterol-delta-14-reductase gene was cloned by selecting strains carrying sequences on a 2-mu vector for resistance to fenpropimorph. Plasmid pMil00 was isolated and shown to carry the structural gene based upon the phenotype of gene disruption strains. The bNA sequence of the 2.5 Sphi/Nabi fragment of pMil00 is given in AA089202 and the encoded 50.5 kDa protein in AAR71934. Over-expression of the DNA in yeast allows assay of inhibitor activity. The present sequence encodes the S. cerevisiae sterol delta-14 reductase, a component of the ergosterol biosynthetic pathway. The sterol delta-14 reductase gene, which was isolated by selecting strains carrying sequences on a 2mu-based to resistance to a morpholine fungicide, e.g. fenpropimorph, or the enzyme can be used in screening tests for the potential fungicides, which may be useful in a wide variety of agricultural, medical and veterinary applications. (Updated on 25-MAR-2003 to correct PF field.)

The present sequence encodes S. cerevisiae sterol delta-14 reductase, a member of the ergosterol biosynthetic pathway, which is useful in devising screening tests to identify sterol biosynthesis inhibitors. The inhibitors are potential fungicides which may be used in various agricultural, medical and veterinary applications. The gene was isolated and cloned by selecting strains, carrying sequences on a 2mu based vector, for resistance to a morpholine fungicide, e.g. fenpropimorph. (Updated on 25-MAR-2003 to correct PF field.)
